Background

There are many graphics systems in R for making plots and figures. These include so-called “*base-R*” graphics like the `plot()` function and add on packages like **ggplot2**.

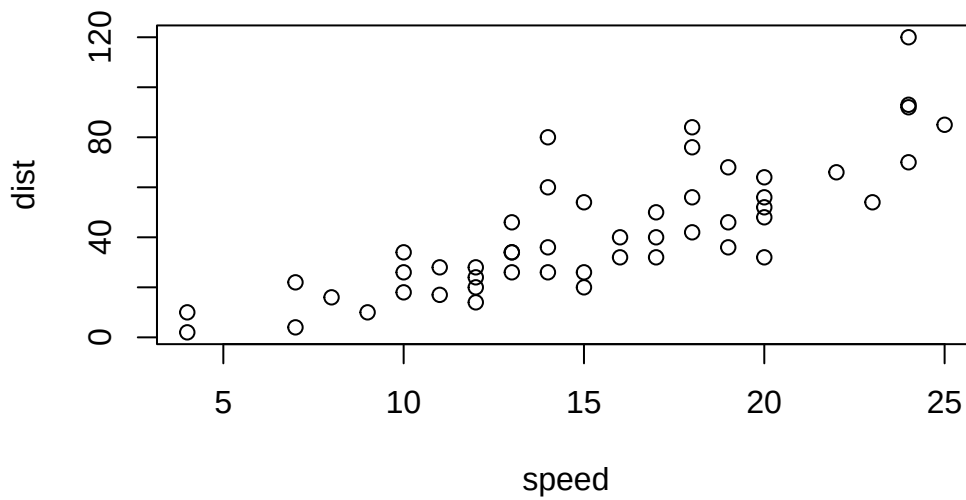

Let’s compare how we make a simple figure with these two systems:

We can use the in-built `cars` dataset:

```
head(cars)
```

```
  speed dist
1     4    2
2     4   10
3     7    4
4     7   22
5     8   16
6     9   10
```

```
plot (cars)
```

Before I can use `ggplot2` I need to install it on my computer. To do this we can use the function `install.packages("ggplot2")`

N.B. We never run `install.packages()` in our quarto doc (we run it once only in our R console) as it would re-install the package every time we render our quarto report.

Once installed we need to load up the package into our R brain:

```
library(ggplot2)
```

The main function in the **ggplot2** package is called `ggplot()`

```
ggplot(cars)
```

Every ggplot has at least 3 layers:

- the **data** (a.data.frame of the stuff we want to plot)
- the **aesthetics** (how the data maps to the plot),
- the **geom** layer () (how you want the plot to be drawn, e.g. points, lines, etc.)

```
ggplot(cars) +  
  aes(x=speed, y=dist ) +  
  geom_point()
```

Add some custom features

Let's add a trend line that shows the relationship between speed and distance.

```
ggplot(cars) +  
  aes(x=speed, y=dist ) +  
  geom_point(color = "turquoise") +  
  geom_abline (color = "pink") +  
  theme_minimal() +  
  labs(title="Stopping Dist of Old Cars",  
        x = "Speed (MPH)",  
        y = "Distance (ft)")
```

Q. Can you make the `geom_smooth()` function produce a linear straight line fit to the data and turn off the “gray” area region.

Gene Plot

```
url <- "https://bioboot.github.io/bimm143_S20/class-material/up_down_expression.txt"
genes <- read.delim(url)
head(genes)
```

	Gene	Condition1	Condition2	State
1	A4GNT	-3.6808610	-3.4401355	unchanging
2	AAAS	4.5479580	4.3864126	unchanging
3	AASDH	3.7190695	3.4787276	unchanging
4	AATF	5.0784720	5.0151916	unchanging
5	AATK	0.4711421	0.5598642	unchanging
6	AB015752.4	-3.6808610	-3.5921390	unchanging

```
sum(genes$State == "up")
```

```
[1] 127
```

A useful new function in this context is the `table()` function:

```
table(genes$State)
```

down	unchanging	up
72	4997	127

My first plot attempt

```
ggplot(genes) +  
  aes(Condition1, Condition2, col=State) +  
  geom_point() +  
  scale_color_manual(values=c("magenta","orange","blue" )) +  
  theme_bw() +  
  labs(x = "No drug", y="Drug")
```

Going further

Here we read the famous gapminder dataset:

```
# File location online
url <- "https://raw.githubusercontent.com/jennybc/gapminder/master/inst/extdata/gapminder.tsv"

gapminder <- read.delim(url)
head(gapminder)
```

	country	continent	year	lifeExp	pop	gdpPercap
1	Afghanistan	Asia	1952	28.801	8425333	779.4453
2	Afghanistan	Asia	1957	30.332	9240934	820.8530
3	Afghanistan	Asia	1962	31.997	10267083	853.1007
4	Afghanistan	Asia	1967	34.020	11537966	836.1971
5	Afghanistan	Asia	1972	36.088	13079460	739.9811
6	Afghanistan	Asia	1977	38.438	14880372	786.1134

Q. How many entries (i.e. rows) are in this dataset?

```
nrow(gapminder)
```

```
[1] 1704
```

Q. How many different “country” entries are in this dataset?

```
length(unique(gapminder$country))
```

```
[1] 142
```

Let’s make our first plot of the entire dataset:

Plot of “gdpPercap” vs “lifeExp” colored by “continent”

```
p <- ggplot(gapminder) +
  aes(gdpPercap, lifeExp, col=continent) +
  geom_point(alpha=0.3)
```

```
p
```

I can add more layers to p

```
p +  
  facet_wrap(~continent)
```

Make a plot for years 1977 and 2007 only (not all the years in the dataset).

Q. First use the **dplyr** package and use the **filter()** function from that package to extract the year 2007.

```
library(dplyr)
library(ggplot2)
```

```
g07 <- filter(gapminder, year== 2007)
g77 <- filter(gapminder, year== 1977)
```

```
ggplot(g07) +
  aes(gdpPercap, lifeExp, col=continent, size=pop) +
  geom_point()
```

```
facet_wrap(~year)
```

```
<ggproto object: Class FacetWrap, Facet, gg>
  attach_axes: function
  attach_strips: function
  compute_layout: function
```

```

draw_back: function
draw_front: function
draw_labels: function
draw_panel_content: function
draw_panels: function
finish_data: function
format_strip_labels: function
init_gtable: function
init_scales: function
map_data: function
params: list
set_panel_size: function
setup_data: function
setup_panel_params: function
setup_params: function
shrink: TRUE
train_scales: function
vars: function
super: <ggproto object: Class FacetWrap, Facet, gg>

```

Q. Make a histogram of lifeExp colored by continent (try using fill = or col=continent or col=continent)

```

ggplot(gapminder) +
  aes(lifeExp, fill= continent) +
  geom_histogram()

```

`stat\_bin()` using `bins = 30`. Pick better value `binwidth`.

Q. Make a histogram of lifeExp faceted by continent

```
ggplot(gapminder) +  
  aes(lifeExp) +  
  geom_histogram()
```

`stat\_bin()` using `bins = 30`. Pick better value `binwidth`.
